
a
Site offsets follow the site proportion
Spearman ρ = 0.79
10 sites with ≥ 30 participants
USM
PITT
UM_2
KKI
training proportion
training-only recalibration
after shift to the site's proportion
calibration-in-the-large (logit)
autistic proportion of the withheld site
b
Correction needs the proportion to within 0.05
numbers: sites with an interval excluding zero
no site information
shifted to the assumed proportion
mean absolute site offset (logit)
error in the assumed autistic proportion
c
Training-set thresholds hold
targeted metric
the other metric
target 0.80
pooled specificity target
pooled sensitivity target
site withheld specificity target
site withheld sensitivity target
0.82
0.80
0.84
0.80
realised on held-out participants
d
Net benefit above treating everyone
research cohort: 46% autistic
recalibrated
native
treat everyone
treat no one
net benefit
threshold probability
e
AUROC by stratum
age < 12
age 12–17
age ≥ 18
motion, lowest third
motion, middle third
motion, highest third
site < 40
site 40–79
site ≥ 80
pooled ten-fold
site withheld
AUROC (95% site-clustered interval)
f
Calibration by stratum
calibration-in-the-large after recalibration (logit)
